

5. For the "Tunnel traffic", choose "Only IPv4"

6. Click on "Download file". You will get a `.conf`-file.

The screenshot shows the WireGuard configuration interface. At the top, there is a 'WIREGUARD KEY' field with a green checkmark and a 'Manage WireGuard keys' button. Below this, there are three selection boxes: 'Austria' (labeled 3), 'Vienna' (labeled 4), and 'at-vie-wg-003' (labeled 4). The 'Advanced settings' section is expanded, showing 'Multihop' (disabled), 'Server connection protocol' (IPv4 selected), and 'Tunnel traffic' (labeled 5) with 'Only IPv4' selected. Below this is a 'CUSTOM PORT' field with '1234' and a list of allowed ports. The 'Configure Content Blocking' section is also visible, with 'Select All' selected and various content types (Ads, Trackers, Malware, Adult content, Gambling, Social Media) listed. At the bottom, there are two buttons: 'Download file' (labeled 6) and 'Generate QR code'.

7. Copy the file to the storage of your SailfishOS-device

Step 2: Importing the file on Sailfish

1. Open the settings-app and navigate to "VPN"
2. In the pull-down menu, choose "Add new VPN"
3. Choose "WireGuard" for the VPN-Type (typically located at the bottom of the list)
4. On the next page, choose to import a "wg-quick.conf" file.
5. A file-chooser-dialog will open. Choose the `.conf`-file we downloaded earlier.
6. The setup will tell you that the import was successful. Now you just need to give the VPN a name.
7. I recommend to choose "Remember login credentials" (or something like that in your language) under the "Advanced"-settings
8. You can now select the VPN in the list to connect to it.
NOTE: If SailfishOS asks for credentials to login, the username is your account number and the password is just the letter "m"
