

Installing WireGuard

Install necessary tools

SailfishOS doesn't provide WireGuard functionality out-of-the-box, so we first need to install a few third-party programs from OpenRepos. You can get all of these either by downloading the RPMs manually from openrepos.net or by using [Storeman](#).

Wireguard userspace implementation

Install the package `wireguard-go` : [Download from OpenRepos](#)

Wireguard userspace tools

Install the package `wireguard-tools` : [Download from OpenRepos](#)

Connman plugin for integrating Wireguard into Sailfish network manager

Install the package "WireGuard for Sailfish (connman plugin)" (`connman-plugin-vpn-wireguard`):
[Download from OpenRepos](#)

VPN plugin for Sailfish OS settings app

Install the package "WireGuard for Sailfish (Settings UI)" (`jolla-settings-networking-plugin-vpn-wireguard`):
[Download from OpenRepos](#)

This plugin is optional but makes using WireGuard much easier.
